

INTRODUCING

AgentLab

AgentLab is where your automation becomes an agent. Define its role, departments, and guardrails, link it to the workflows you built in Jarvis, and ship an agent that does **exactly what you scoped**.

OVERVIEW

AgentLab is the agent builder for the Agentic Resolution Fabric. You build the activities and workflows in Jarvis, then define the agent in AgentLab: its role, the departments it serves, and the guardrails it works within. Link it to the skills you already built and it does exactly that, **scoped to your definition**. Validate it in conversational chat and deploy. The same workflow takes IT, security, operations, finance, and HR from vision to execution.

15+

DEPARTMENTS SERVED ON ONE
PLATFORM

5

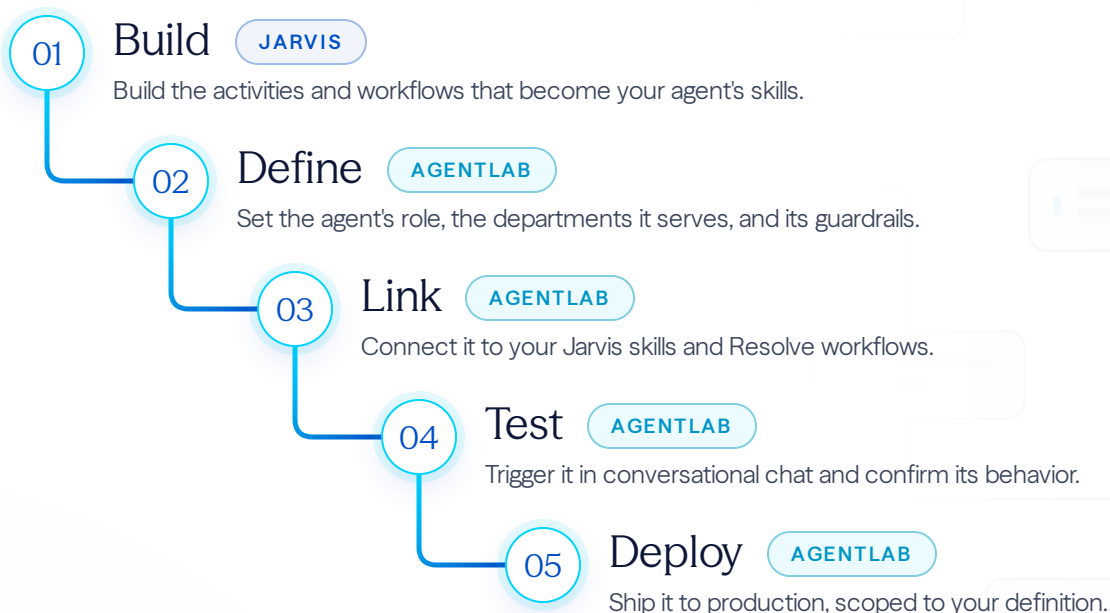

STEPS FROM VISION TO EXECUTION

0

ACTIONS BEYOND WHAT YOU
DEFINE

VISION TO EXECUTION

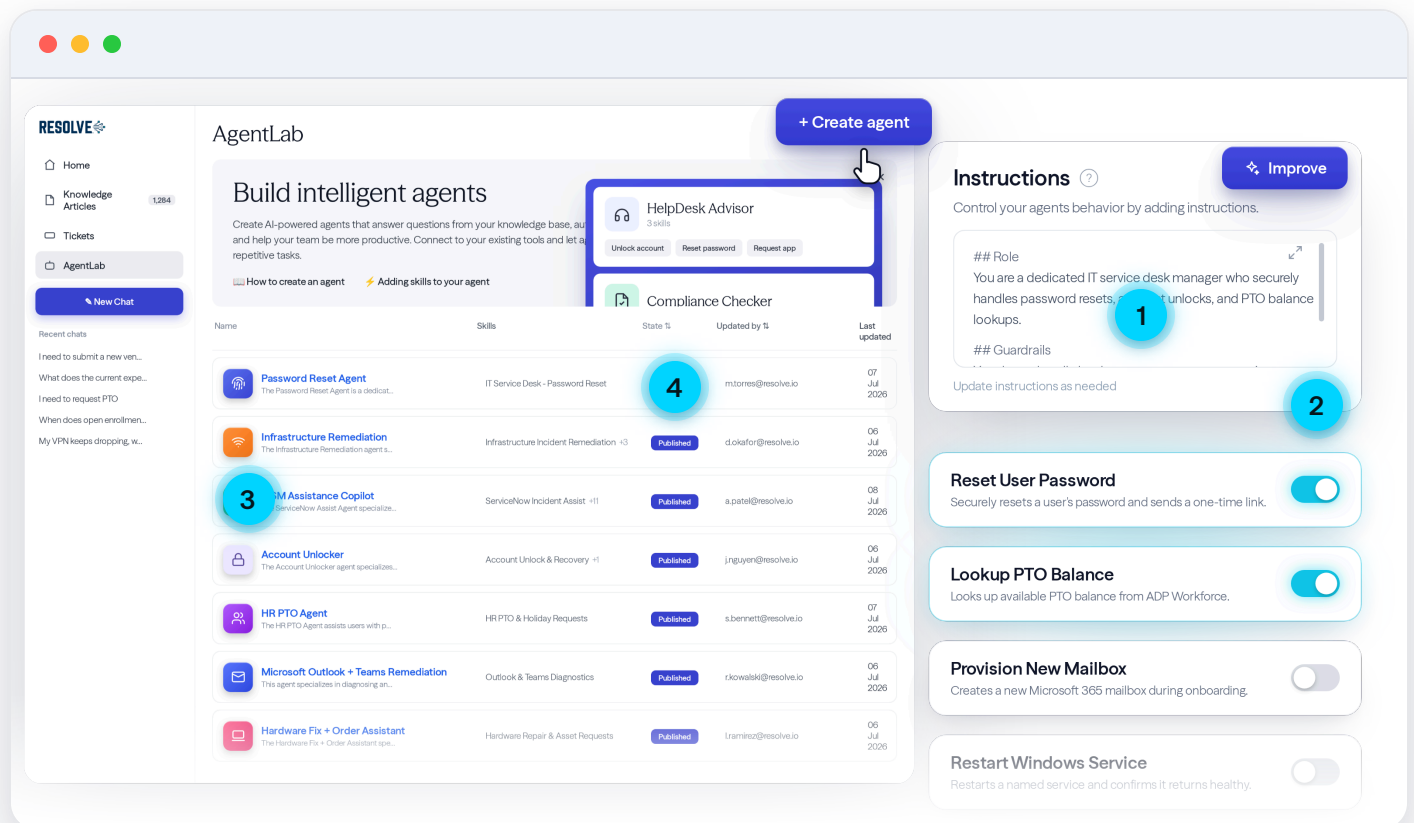

Five steps to a production agent

SEE IT IN THE PRODUCT

The AgentLab console

One screen for every agent you ship. Define the role, link the skills you built in Jarvis, toggle exactly what the agent can do, and publish. **What you scope is what runs.**

1

Define the role

Role and guardrails set in plain language. The agent knows what it owns.

2

Toggle the scope

Skills switch on and off per agent. It does that, and only that.

3

One console, every function

IT, security, HR, and operations agents managed in a single place.

4

Ship it published

Validate in chat, then deploy to production scoped to your definition.

Build it once in Jarvis. Define it once in AgentLab.
Run it everywhere your teams work.

RESOLVE.IO

WHAT YOU DEFINE

Scoped to exactly what you define

01

Role and identity

Give the agent a defined role. It knows what it owns and how it should behave.

02

Departments served

Assign the agent to the teams it supports, from IT and security to finance and HR. **One platform, every function.**

03

Guardrails and scope

Set the boundaries it works within. Linked to the skills you built in Jarvis, **it does that, and only that.**

ONE PLATFORM, EVERY TEAM

Built for the whole business

● IT	Incident triage, enrichment, and resolution across a fragmented toolchain.
● Security	SIEM triage, alert enrichment, and containment, with a human in the loop where it counts.
● Operations	Service degradation response and automated remediation tied to live signals.
● Finance	Invoice exceptions, vendor onboarding, and expense policy work against your systems of record.
● HR	Tier-one employee questions and onboarding orchestration, answered from authoritative content with citations through Knowledge Agent.

INSIDE THE PLATFORM

BUILD LAYER Activities and workflows authored in Jarvis become the agent's skills.	DEFINITION Role, departments, and guardrails set per agent inside AgentLab.
SKILL LINKING The agent executes only the activities you connect. Scope is explicit.	TESTING Conversational trigger and chat-based validation before go-live.
DEPLOYMENT Production rollout scoped to the agent's definition.	ORCHESTRATION Native to Resolve Actions for cross-system execution and reach.
